Java Programms
App2.java

The file **App2.java** is provided with the following program:

```
interface Shape1 {
    String color="RED";
    double area();
}

class Rectangle1 implements Shape1 {
     // Fill your code here
}

class App2 {
  public static void main(String[] args) {
     Rectangle1 r1 = new Rectangle1(2.0, 3.0);
     System.out.println ("Rectangle: " + r1);
     System.out.println ("Area of Rectangle: "
+ r1.area());
    }
}
```

Complete the **Rectangle1** class so that the program runs correctly. The program creates a rectangle with **length** 2.0 and **width** 3.0. The rectangle also has an additional property **color** of type String initialized with the value **RED**. Next, the program displays the properties of the rectangle and its area.

Do not modify the code of the interface Shape1 or the class App2.

The expected execution output of the program is given below:

```
Rectangle: Color RED length 2.0 width 3.0
Area of Rectangle: 6.0
```

Complete the code in the file **App2.java**.

Every program must compile and run from the command line (not through an IDE).
