ATHANASIOS GOURDOMICHALIS
Java Programms
App3.java

The file **App3.java** is provided, containing the classes **Calculator** and **App3**:

```
class Calculator {
    // Fill your code here
}

class App3 {
    public static void main(String[] args) {
        Calculator calculator = new Calculator();
        System.out.println("Add two integers: "
                + calculator.add(3, 7));
        System.out.println("Add three integers: "
                + calculator.add(3, 4, 3));
        System.out.println("Add two doubles: "
                + calculator.add(9.8, 0.2));
        System.out.println("Add array of integers: "
                + calculator.add(new int[]{2, 3, 2,
3}));
    }
}
```

Complete the **Calculator** class so that the **App3** class executes correctly.

Specifically, write the **add** method of the **Calculator** class in all its required versions (**method overloading**), so that each time it returns the sum of the numbers passed as arguments.

The **add** method can accept as arguments either **two integers**, **three integers**, **two doubles**, or **an array of integers**.

Do not modify the App3 class (main).

Complete the code in the file **App3.java**.

Every program must compile and run from the command line (not through an IDE).
