Java Programms
App4.java

The file **App4.java** is provided, containing the classes **Author**, **Book**, and **App4**:

```
class Author {
    // Fill your code here
}

class Book {
    // Fill your code here
}

class App4 {
    public static void main (String[] args) {
        Author author1 = new Author("J. K. Rowling",
"USA");
        Author author2 = new Author("Hawking Stephen",
"USA");
        Book book1 = new Book("Harry Potter",
author1);
        Book book2 = new Book("Universe In A
Nutshell", author2);
        System.out.println(book1+"\n "+book2);
    }
}
```

Complete the classes **Author** and **Book** so that class **App4** executes correctly. You must not modify the **App4** class.

Specifically, for each class (**Author**, **Book**), define its fields (using any names you prefer), a constructor method, and a **`toString()`** method based on the requirements of the **App4** class. Note that when creating an object of type **Book**, a corresponding **Author** object is used (Object composition).

Complete the code in the file **App4.java**.

Every program must compile and run from the command line (not through an IDE).
