Java Programms
App5.java

The file **App5.java** is provided, containing the classes **Shape**, **Rectangle**, **Triangle**, and **App5**:

```
class Shape {
    private String color;
    Shape (String color) {
        this.color = color;
    }
    public String toString () {
        return "Color " + color;
    }
}

class Rectangle extends Shape {
    // Fill your code here
}

class Triangle extends Shape {
    // Fill your code here
}
class App5 {
    public static void main(String[] args) {
        Rectangle r1 = new Rectangle("RED", 2.0, 3.0);
        Triangle t1 = new Triangle ("YELLOW", 2.0,
3.0);
...
...
```

```
        System.out.println ("Rectangle: " + r1);
        System.out.println ("Area of Rectangle: " +
r1.area());
        System.out.println ("Triangle: " + t1);
        System.out.println ("Area of Triangle: " +
t1.area());
    }
}
```

Complete the classes **Rectangle** and **Triangle** so that class **App5** functions correctly. The program creates a **rectangle** with properties its color (of type `String`), its length, and its width (of type `double`), and a **triangle** with properties its color (of type `String`), its height, and its base (of type `double`). Next, it displays the properties of the rectangle and its area. It also displays the properties of the triangle and its area.

Do not modify the code of the Shape class or the App5 class.

The execution output of the program is given below:

```
Rectangle: Color RED length 2.0 width 3.0
Area of Rectangle: 6.0
Triangle: Color YELLOW base 2.0 height 3.0
Area of Triangle: 3.0
```

Complete the Java code in the file **App5.java**

Every program must compile and run from the command line (not through an IDE).
