ATHANASIOS GOURDOMICHALIS
Java Programms
Customer.java
myDate.java

The class **Customer** contains the customer data, which are:

- the customer's name (type `String`),
- the customer's code (type `String`), and
- the customer's registration date in the client list (type **myDate**).

1. Define the class **myDate** with data representing three integers for the day, month, and year of the customer's registration as private member variables of the class. Also, define the constructor and any other method needed.

```
class myDate {
    // Fill your code here
}
```

2. Define the class **Customer** containing the customer **data** and a **constructor** method that takes two strings (name and code) and three integers (**registration date**) as parameters. Declare the data variables as private. Also, define any other method needed.

```
class Customer {
    private String name;
    private String code;
    private myDate date;
    Customer(String name, String code, int d, int m,
int y){
        // Fill your code here
    }
    // Fill your code here
}
```

Complete the files **myDate.java** and **Customer.java**

Every program must compile and run from the command line (not through an IDE).
